

Ten top tips

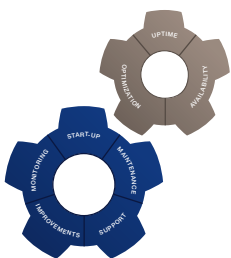

to keep your decanter in tip top condition

- 1 Ensure the key operating parameters (speed, solids density, feed rate) match the original design specifications.
- 2 Monitor the machine daily. Check vibrations and bearing temperatures. Look for leaks and investigate any abnormal noise.
- 3 On a weekly and monthly basis, check the casing for any solids build up (and remove if necessary).
- 4 Periodically check all automatic monitoring systems and shut-off devices for correct operation.
- 5 Every six months or 1 000 hours, check – and adjust – gearbox oil level and belt tension.
- 6 Always stick to the recommended lubrication intervals and the instructions for preventive maintenance.
- 7 Use only the approved brands of grease and oil and make sure they are within the recommended shelf life.
- 8 Keep service area and decanter surroundings clean. Always clean parts thoroughly before assembly. Tighten screws to the correct torque levels.

- 9 Use only genuine OEM-supplied tools for service and maintenance and store the tools in a clean, dry location.
- 10 Use only genuine spare parts for guaranteed performance, reliability and equipment life. Maintain a stock of key spare parts like grease, oil, intermediate and major service kits.
